# Agenda

- ▶ Kurze Umfrage
- ▶ Was ist Puppet?
- ▶ Was ist Foreman?
- ▶ Puppet@s-iTSolutions
- ▶ Was haben wir geplant?

# Umfrage

# Was ist Puppet?

- ▶ Declarative programming: telling the machine what you would like to happen, and let the computer figure out how to do it.
- ▶ Imperative programming: telling the machine how to do something

```
1  class linuxwochen2014 (  
2      $ensure = present  
3  ) {  
4      user { 'toni':  
5          ensure => $ensure,  
6          uid    => 4711,  
7          gid    => 100,  
8      }  
9  
10     package { 'emacs-nox':  
11         ensure => installed  
12     } ->  
13     package { 'vim-enhanced':  
14         ensure => absent,  
15     }  
16 }
```

# Zuordnung von Klassen

- ▶ über `/etc/puppet/manifests/site.pp`

2

```
node /^(foo|bar)\.linuxwochen\.at$/ {  
    include linuxwochen2014  
}
```

- ▶ über Hiera (`hiera_include('classes',[""])`)
- ▶ über einen External Node Classifier (Foreman)

# Node classification

```
1  ---
2  classes:
3    black:
4      puppetmgmt:
5        manage_config: true
6        puppetmaster: puppetd
7        puppet_version: 3.2.4
8      sudo:
9        config_dir: /etc/sudoers.d/
10       config_file: /etc/sudoers
11       config_file_replace: false
12       package: sudo
13       package_source: ''
14       purge: false
```

# Puppet Environments

- ▶ Environments sind unabhängige Puppet Umgebungen
- ▶ Ein Master kann mehrere Environments zur Verfügung stellen

```
2 /etc/puppet/modules/...  
  /etc/puppet/manifests/site.pp  
  
4 /etc/puppet/environments/linuxwochen/modules  
  /etc/puppet/environments/linuxwochen/manifests/site.pp
```

# Was ist Foreman?

### Run distribution in the last 30 minutes

# Puppet run

Und jetzt?

- ▶ Wie soll eine Entwicklungsumgebung aussehen?
- ▶ Wie testen wir den Puppet Code?
- ▶ Wie verwalten wir unseren Puppet Code?
- ▶ Wie soll unsere Puppet Umgebung aussehen?
- ▶ Wie erfolgt das Deployment des Codes?
- ▶ Wie verwalten wir Module von PuppetForge?

Wie soll eine Entwicklungsumgebung  
aussehen?

# Vagrant

- ▶ <http://vagrantup.com>
- ▶ Ermöglicht virtuelle Entwicklungsumgebungen
- ▶ Vagrant Box ist ein vorkonfiguriertes Image
- ▶ Default VirtualBox andere Provider via Plugins (VMWare, KVM)

# Demo

# Wie testen wir den Puppet Code?

# rspec-puppet

- ▶ Ruby RSpec Tests für Puppet
- ▶ Jedes Module muss RSpec Tests mitbringen

```
1 require 'spec_helper'
2 describe 'linuxwochen2014' do
3   let :facts { { :osfamily => 'RedHat' } }
4
5   context 'ensure is set to absent' do
6     let :params { { :ensure => 'absent' } }
7
8     it do
9       should contain_user('toni').with({
10         'ensure' => 'absent',
11         'uid'    => '4711',
12         'gid'    => '100',
13       })
14     end
15
16     it { should contain_package('emacs-nox').with_ensure('installed') }
17     it { should contain_package('vim-enhanced').with_ensure('absent') }
18     it { should contain_package('emacs-nox').that_comes_before('Package[vim-enhanced]') }
19 end
end
```

# Demo

# Wie verwalten wir unseren Puppet Code?

# GIT

- ▶ Ein zentrales GIT Repository
- ▶ 3 Hauptbranches
  - ▶ Master
  - ▶ Testing
  - ▶ Production
- ▶ Feature Branches für neue Module
- ▶ Berechtigungssystem mit Gitolite

Wie soll unsere Puppet Umgebung  
aussehen?

Wie erfolgt das Deployment des  
Codes?

# Umgebungen

- ▶ Development (Master)
  - ▶ Test auf 7 Entwicklungsserver
  - ▶ Push auf Remote Master Branch löst Deployment aus
  - ▶ RedHat 5,6 / Solaris sparc,i386 10,11 / AIX
- ▶ Testing
  - ▶ ca. 30 “Produktions” Server
  - ▶ Annotated Tags werden automatisch deployed (test\_\*)
- ▶ Production
  - ▶ ca 1000 Hosts
  - ▶ Annotated Tags werden automatisch deployed (prod\_\*)

# Jenkins CI

- ▶ Continuous Integration Server
- ▶ Führt Jobs aus (z.b. Shell Scripts)
- ▶ Monitored und liefert Status Jobs
- ▶ Es können Abhängigkeiten zwischen Jobs definiert werden

# Puppet Umgebung und Deployment

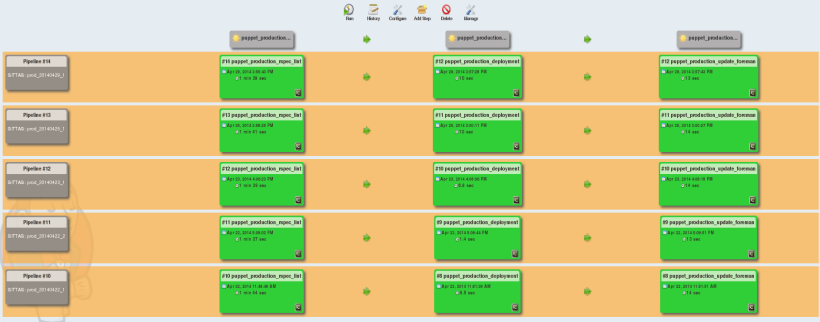

- ① Features Branches get automatically created on Puppet Master (Dynamic Environments)
- ② Master Branch gets deployed on commit via Jenkins
- ③ Testing Branch gets deployed via GIT tag (test\_\*)  
a normal commit to the Testing branch only runs tests
- ④ Production Branch gets deployed via GIT tag (prod\_\*)  
a normal commit to the Production branch only runs tests

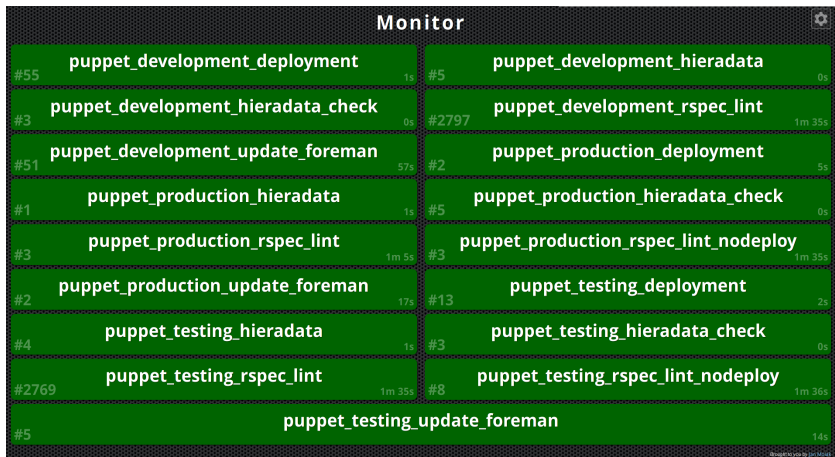

It's all the same for Hiera yaml files, except dynamic environments!

# Deployment

## Build Pipeline: Puppet Production

# Monitoring

# Wie verwalten wir Module von PuppetForge?

# Puppetforge Module

- ▶ Eigenes GIT Repository (puppetforge.git)
- ▶ Download der Module in der Entwicklungsumgebung via `puppet module install ...`
- ▶ Staging GIT pull (bäh!)
- ▶ Dies ändert sich allerdings (dazu später)

- ▶ Wie soll eine Entwicklungsumgebung aussehen? *DONE*
- ▶ Wie testen wir den Puppet Code? *DONE*
- ▶ Wie verwalten wir unseren Puppet Code? *DONE*
- ▶ Wie soll unsere Puppet Umgebung aussehen? *DONE*
- ▶ Wie erfolgt das Deployment des Codes? *DONE*
- ▶ Wie verwalten wir Module von PuppetForge? *DONE*

# Probleme, Probleme, Probleme...

- ▶ Ein GIT Repo funktioniert nicht bei Änderungen von Upstream Modulen
- ▶ Andere Abteilungen sollen ihre Module unabhängig testen
- ▶ Unittests sagen noch nichts aus, wie sich der Code am Live-System verhält
- ▶ Wir sollten eigentlich das Zusammenspiel aller Module testen (Forge und eigene)

# Was haben wir geplant?

- ▶ r10k für Deployment  
(<https://github.com/adrienthebo/r10k>)
- ▶ Ein Repository pro Module
- ▶ Nur interne Module bleiben im Hauptrepo
- ▶ Acceptance Tests mit Beaker
